

Ideation Phase

Define the Problem Statements

Date	28 June 2026
Team ID	Sahanaa V
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Problem Statement

In modern enterprise environments, provisioning internal network resources—such as deploying specific hardware configurations or setting up dedicated connection types across disparate corporate locations—is heavily constrained by manual intervention. The lack of an integrated system manifests as a broken, highly fragmented workflow characterized by the following systemic issues:

- **Opaque Tracking and Operational Bottlenecks:** End-users submitting infrastructure requests face complete radio silence. Because requests are typically routed through unmonitored generic email inboxes, paper forms, or disjointed manual ticketing systems, there is zero status transparency. This results in lengthy delay cycle times, leaving employees blocked and unproductive.
- **Administrative Fatigue and Process Slippage:** Network engineering teams are buried under repetitive administrative overhead. They are forced to manually track down managerial email approvals, cross-reference data validation points, and double-enter data across platforms. This continuous manual overhead increases the risk of data entry mistakes and compliance slip-ups.
- **Disconnected Data Architecture:** The core breakdown occurs between authorization and final logging. Because there is no automated, direct interface connecting a catalog form to an live approval engine and subsequent database tables, the network infrastructure log remains prone to synchronization issues, leading to critical visibility gaps across the IT environment.
